

SUSTAINABILITY ISN'T IDEOLOGY. IT'S PHYSICS.

No opinions. No politics. Just how systems work.

Earth is a closed system

Energy comes in from the sun. That's it. Matter doesn't leave.

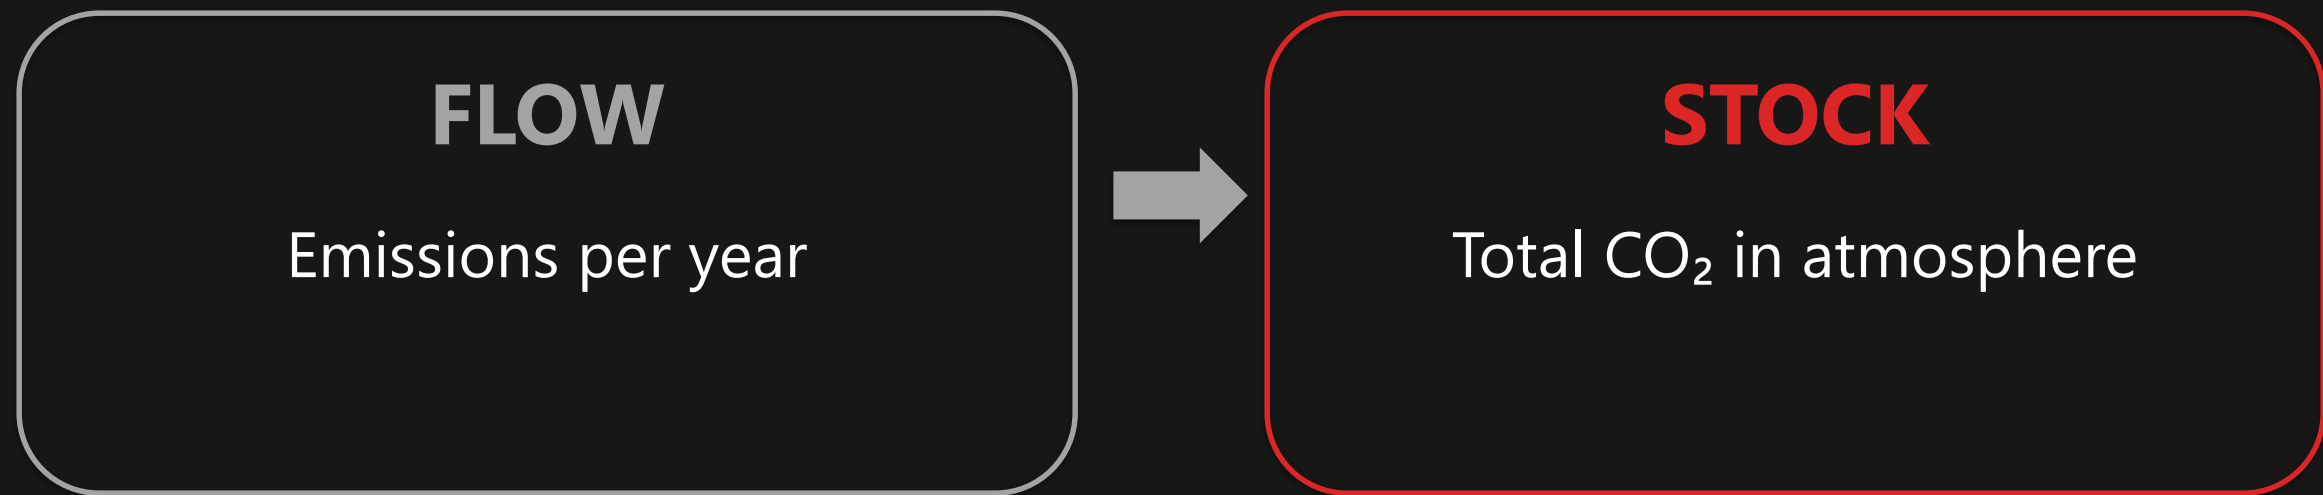

No exit.

No reset button.

Outputs accumulate.

Stock vs. Flow

The problem isn't emissions alone. It's accumulation.

Even if we slow the flow, the stock keeps rising until the flow drops below what the system absorbs.

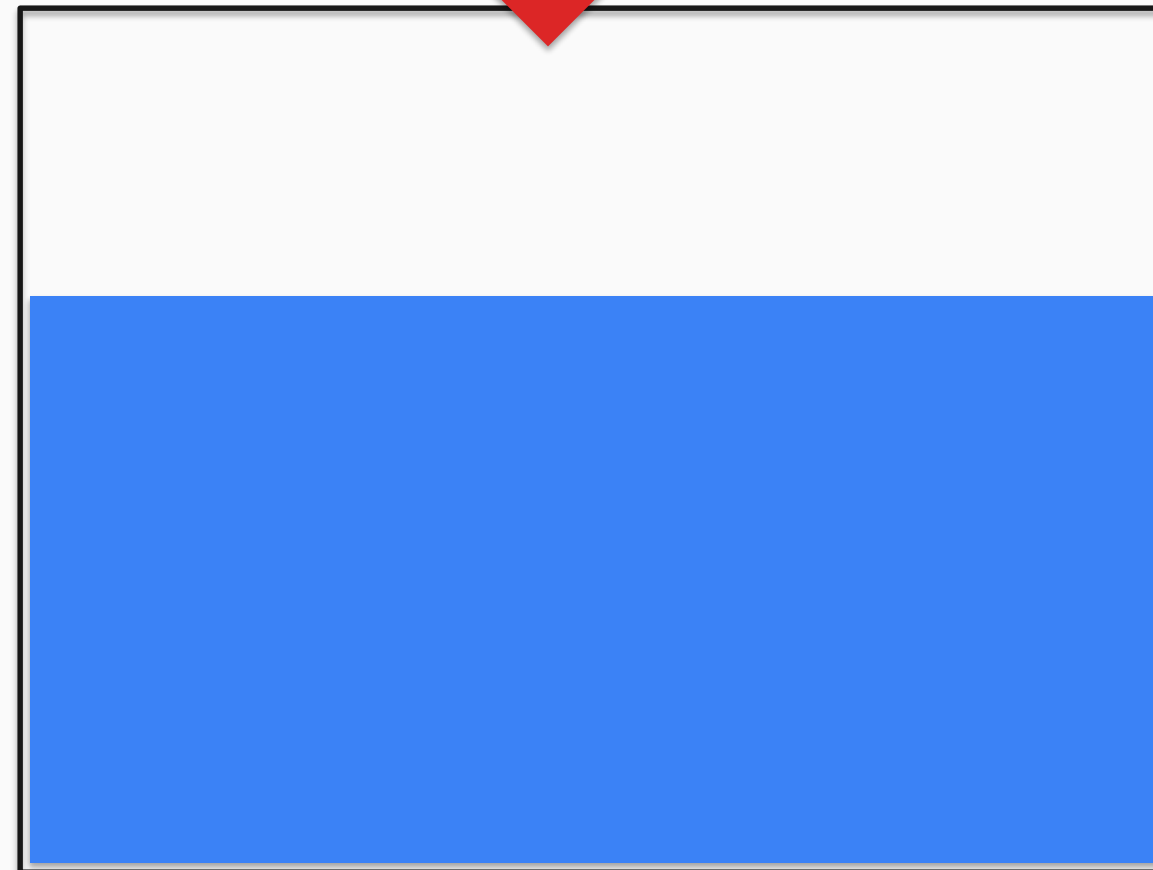

The Bathtub

CO₂ IN

Stock vs. flow — in your bathroom.

Fossil fuels, industry,
land use

**The tap is running
faster than the
drain can empty.**

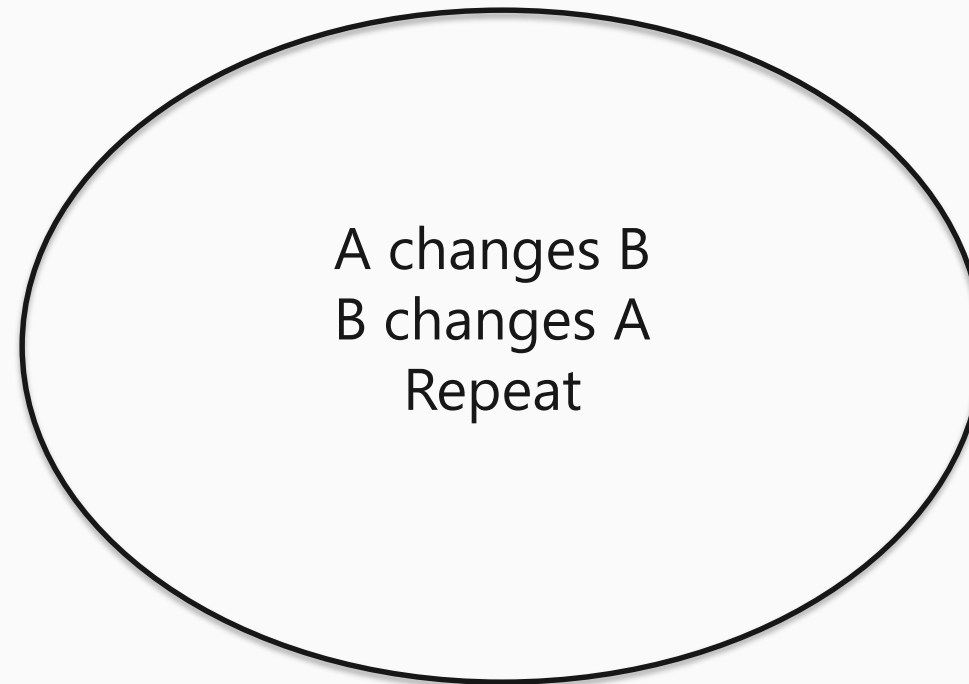

CO₂ OUT

Oceans, forests,
natural absorption

That's not ideology.
That's a bathtub
overflowing.

What is a feedback loop?

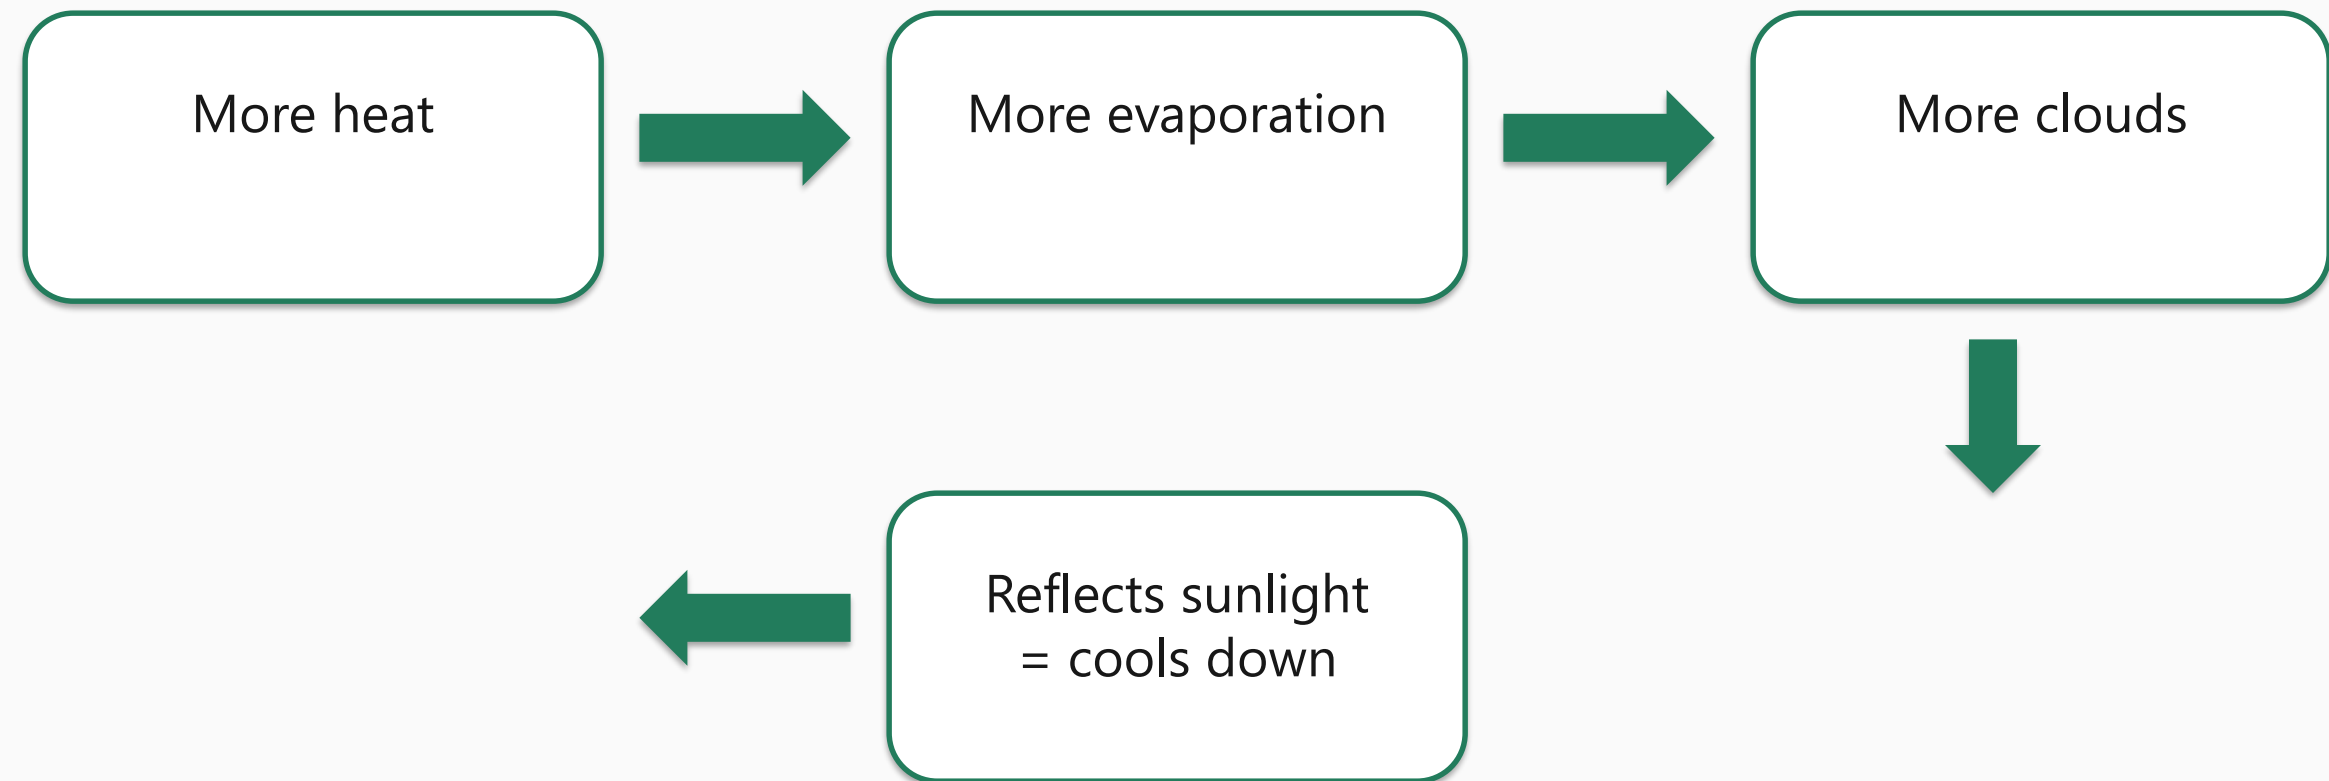

When the output of a system becomes an input that changes the system itself.

Two kinds: some stabilize. Some amplify.

Stabilizing Feedback

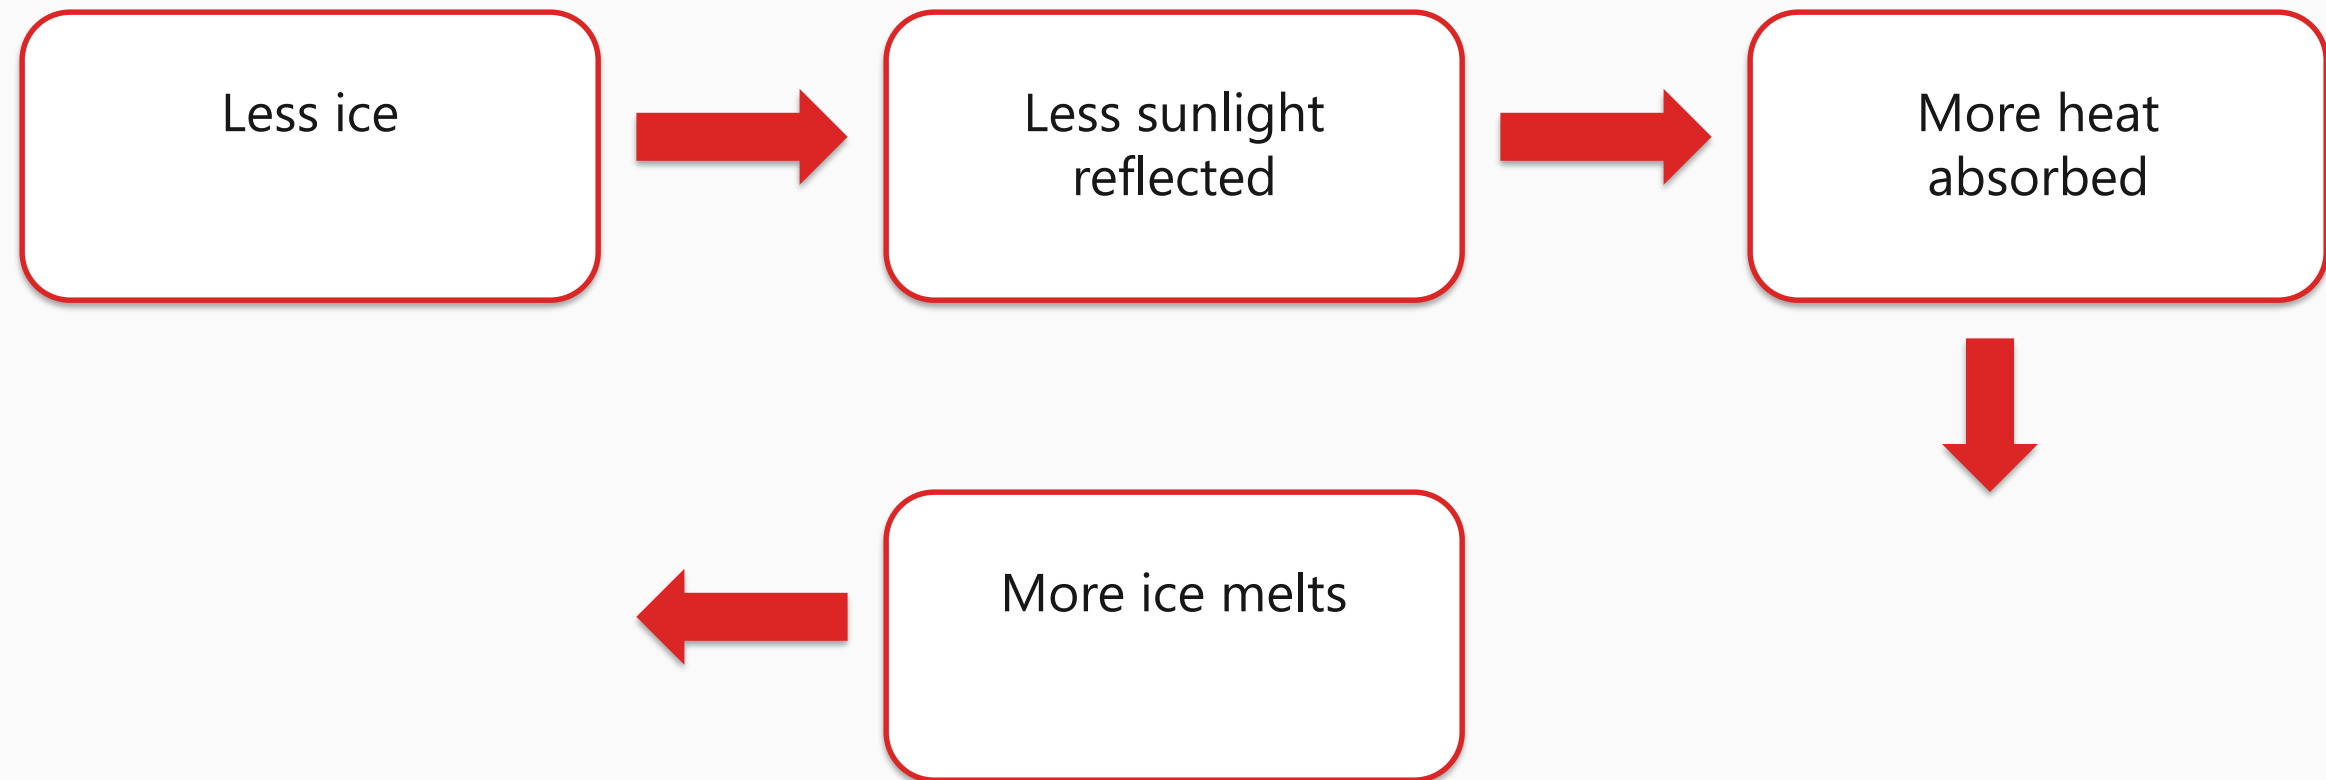

The system pushes back. It self-corrects.

The system has a thermostat. It tries to stay balanced.

Amplifying Feedback

The system accelerates itself. No brakes.

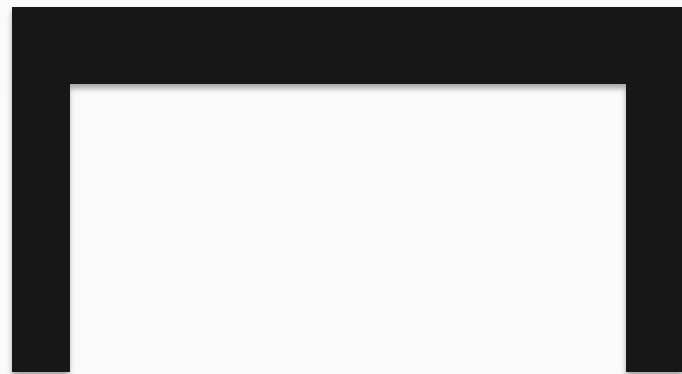

This isn't a prediction. This is measured, observed, documented.

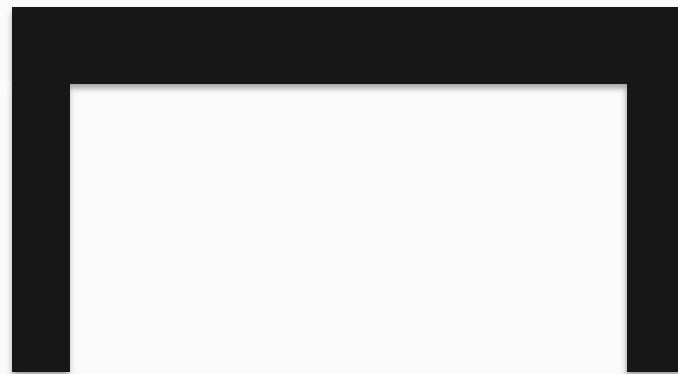

Tipping Points

Systems don't degrade gradually. They hold — then shift.

HOLDS

HOLDS

BREAKS

A rainforest can handle some clearing.

Past a threshold, it becomes savanna.

That transition isn't reversible on human timescales.

**These physical systems are driven
by human activity.**

But not equally.

71%

of global industrial greenhouse gas emissions

100 companies.

The chemicals in your water. The microplastics in your food.
Industrial-scale decisions by a small number of very large companies.
Not Jim's tire shop. Not Svenja's sewing company.

The physics is real.

The environment matters. That's not the debate.

The debate is:

Who's responsible?

Who's paying?

Does the system built to 'fix' it actually work?

Next: How did we get here?

From "don't dump chemicals in the river"
to a \$30 billion compliance industry.
