

SUSTAINABILITY IS PHYSICS

Not a belief system. Not a political stance. Just cause and effect.

Earth is a closed system

Matter doesn't leave.
No exit. No reset button.

Some outputs the system can absorb. Some it can't — or not fast enough.

The Bathtub

CO₂ IN

(fossil fuels,
industry, land use)

CO₂ OUT

(oceans, forests,
natural absorption)

**The tap is running
faster than the
drain can empty.**

That's not ideology.
That's a bathtub
overflowing.

Feedback Loops

Systems don't just change. They amplify or stabilize.

STABILIZING

More heat → more evaporation
→ more clouds → reflects sunlight
→ cools down

Self-correcting

AMPLIFYING

Less ice → less reflection
→ more heat absorbed
→ more ice melts → repeat

Self-reinforcing

The Ice-Albedo Feedback

This isn't a prediction. This is measured, observed, documented.

Tipping Points

Systems don't degrade gradually. They hold — then shift.

HOLDS

HOLDS

BREAKS

A rainforest can handle some clearing.

Past a threshold, it becomes savanna. That transition isn't reversible on human timescales.

71%

of global industrial greenhouse gas emissions

100 companies.

The chemicals in your water, the microplastics in your food —
those come from industrial-scale decisions made by a small number of very large companies.
Not from Jim's tire shop. Not from Svenja's sewing company.

The physics is real.

The environment matters. That's not the debate.

The debate is:

Who's responsible?

Who's paying?

Does the system built to 'fix' it actually work?

Next: How did we get here?

From 'don't dump chemicals in the river'
to a \$30 billion compliance industry.
